

¹³C Isotope Labeled

Reference Materials

Biopure™ fully stable ¹³C isotope labeled referenced materials play a pivotal role in LC- MS/MS analysis. They are widely used in multi-analyte methods to eliminate recovery losses.

How Biopure™ fully stable ¹³C isotope labeled referenced materials work

¹³C isotope labeled Mycotoxins are used as internal standards (ISTD) for mass spectrometry (MS).

All constituting carbon atoms in the molecule are replaced by the stable carbon isotope ¹³C. Because of the similar chemical structure of analyte and ¹³C analogue these substances behave similar in liquid chromatography but differentiate in mass spectrometry. With the use of ¹³C fully labeled internal standards recovery losses from sample preparation and ion suppression or enhancement effects in the MS source can be eliminated.

Application in LC-MS/MS – Routine Analysis

To keep costs efficient the point of internal standard addition of the sample into the MS system is crucial. Depending on the sensitivity of the MS system used ISTD can be added to the analytical sample prior to clean-up or prior to injection into the LC-MS/MS system. All recovery losses from the point of addition onwards are eliminated.

Features and Benefits

- Correct matrix effects
- Fully labeled calibrants show an optimum mass unit difference between analyte and IS
- Results with high accuracy and precision
- No isotope effects due to the fully labeled ¹³C calibrants
- State-of-the-art technology
